

Macrologic. Business never stops

Macrologic specializes in designing and implementation of IT solutions for enterprises. Based on the competences of its consultants and the experience in collaboration with its customers, the company advises entrepreneurs on how to optimize and develop the methods of operation of their enterprises by using modern IT tools.

business never stops

The company was established in 1986 as MacroSoft, and became Macrologic two decades later. Since 2000, the company's shares are listed on the Warsaw Stock Exchange. Currently, the Macrologic group of companies comprises Macrologic SA and 13 field units, one subsidiary and one affiliated company. The company employs 300 people — specialists in the fields of IT and management.

Xpertis — intelligent enterprise management systems

The main product of the company is Xpertis — an IT solutions package, supplemented with consultancy services, that supports enterprise resource planning and recording (ERP), ensures effective information as well as knowledge management (KM, CRM), and enables management analyses (BI).

Xpertis supports the work of persons in charge of running the business — with the generated statistics, reports and analyses, they can quickly define the needs of the company and respond to the current business situation. The system is a group of independent and fully compatible modules that correspond to five main areas of management: finance, controlling, human resources, sales and logistics, production.

Xpertis for shipping

Xpertis for shipping companies supports management of operational activities in enterprises engaged in transporting goods using their own fleets of vehicles, as well as outsourcing these services to third parties. It is a complete solution for managing the shipping process, from the first contact with the contractor, to sending the notification about the delivery of goods and sending an invoice. It's suited both for the transport and logistics companies, as well as for the trading companies with their own fleets. It provides support in the following areas:

- management of shipping and transport orders (domestic and foreign);
- management of fleet and cargo terminals, as well as planning transport routes;
- management of contracts with the contractors;
- management of schedules of deliveries to the clients;
- settlement of traders, drivers and shippers;
- management of documents and the system of electronic document flow;
- monitoring transport costs in various arrangements and auditing VAT accounts.

With the functionality to record all costs associated with the orders, the system can be the basis for planning, controlling and settling orders as well as managing settlements with the customers. The possibility of a thorough analysis of the orders can increase their profitability, electronic transport planning contributes to the optimization of transport routes, and the possibility of settling the labor of shippers, traders and drivers increases the efficiency of their work.

Combined with other Xpertis applications, the system can improve the company's performance to ultimately increase its profitability and competitiveness when compared to other business entities in the respective industry. The Macrologic solutions supporting operational activities — transport and shipping — are related to finance, human resources, sales and customer relationship management as well as storing. They allow users to precisely control operating costs across the enterprise with the use of management accounting and controlling.
